

See what your **bank can't**.

A bank statement shows the store **total**, never the items. So you never see your real habits, or the quiet price creep hiding inside that one number.

YOUR BANK SEES

TARGET

One line. That's all you ever get.

\$87.00

VS

 **SPENDETECTOR SEES**

Oat milk	\$5.65
----------	--------

Oat milk price	↑ 26%
----------------	-------

Eggs, dozen	↑ 54%
-------------	-------

+ 19 more items	itemized
-----------------	----------

Budgeting apps

Copilot, Rocket Money, Cleo. They categorize the total.

✗ never see the items

Reward apps

Fetch and friends read your items, then sell the data.

⚠ you are the product

Spendetector

Reads every item, keeps it in your private Notion.

✓ your items, yours to keep

Snap a receipt. **Itemized intelligence** back.

Every line item, read and sorted

Auto-categorized into 8 categories, plus food group and a health tier (green / yellow / red).

Shrinkflation watch

Per-item price history. "Your oat milk went up 18% since March."

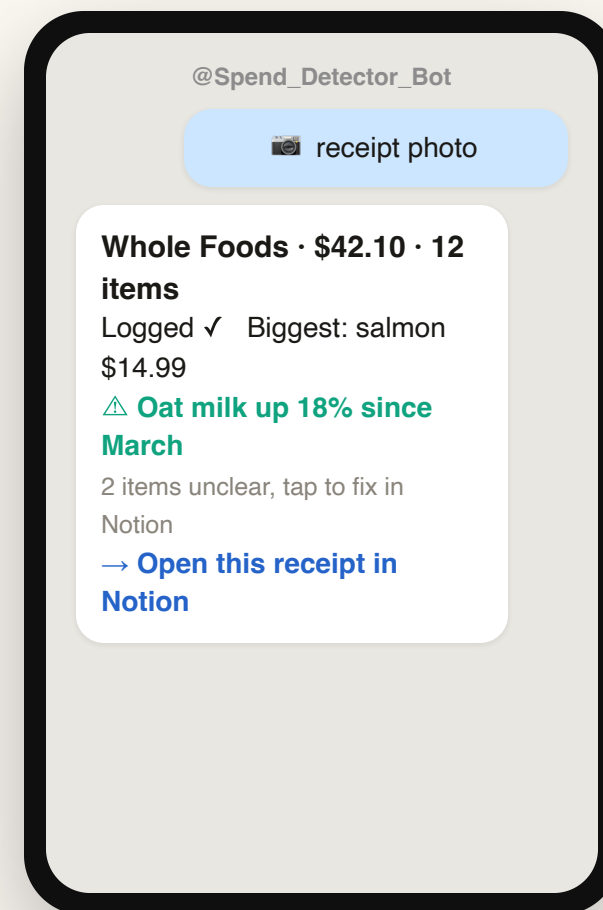

A report card, recipes, and a menu

Total, biggest item, and a health breakdown, plus 2-3 recipes from what you bought and a "Tonight's Menu" picture.

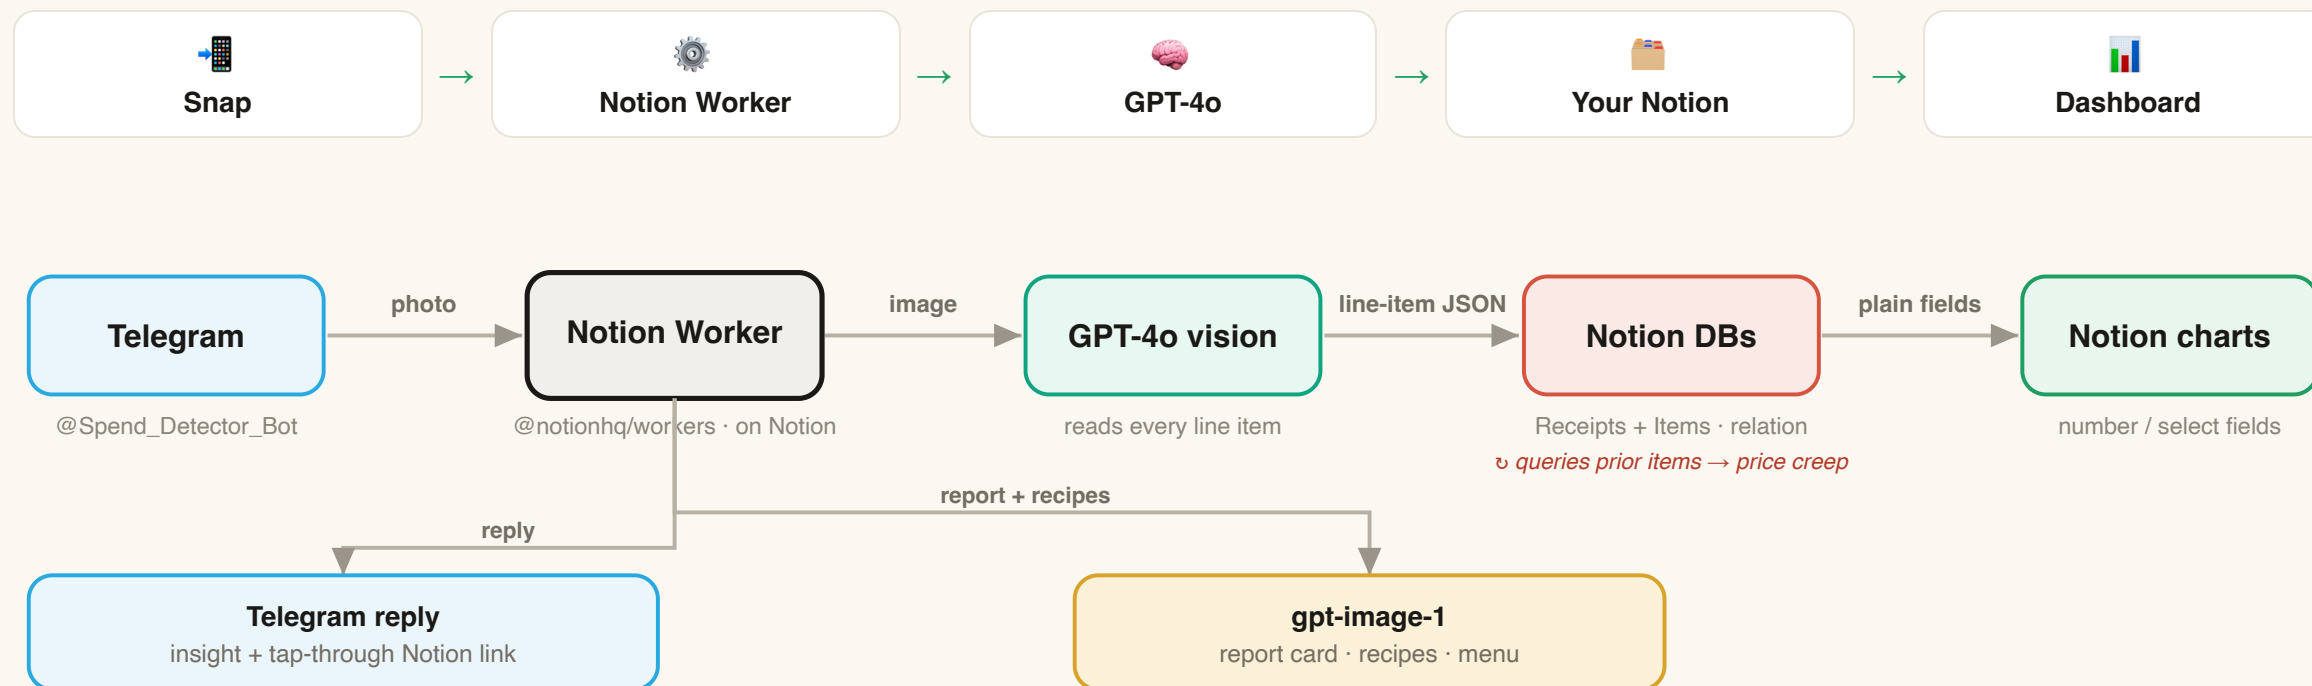

Lives in your own Notion

A row per item, in your private workspace. Fix a mis-read category in a tap.

Every piece, wired together. And it all lives on Notion.

The contract

A strict JSON schema is the handshake between the AI and Notion.

The relation

One receipt ↔ many item rows. That's what makes per-item history work.

The chart trick

Charts can't read formulas, so the worker writes plain fields they can plot.

Privacy by wiring

Card digits aren't in the schema, so they're never read, never stored.

I deleted the server. **Notion runs the code now too.**

No separate server. No custom app to build. The code runs on Notion, the data lives in Notion, and the dashboard *is* Notion.

Runtime

Notion Workers run the code. No
Modal, no VPS, no Mac.

Database

Receipts + Items, linked, in your
workspace.

Dashboard

Native Notion charts, built on the
fields the worker writes.

Editor

Fix a mis-read category in a single
tap.
